

# CT5102: Programming for Data Analytics

## Lecture 12: Course Summary

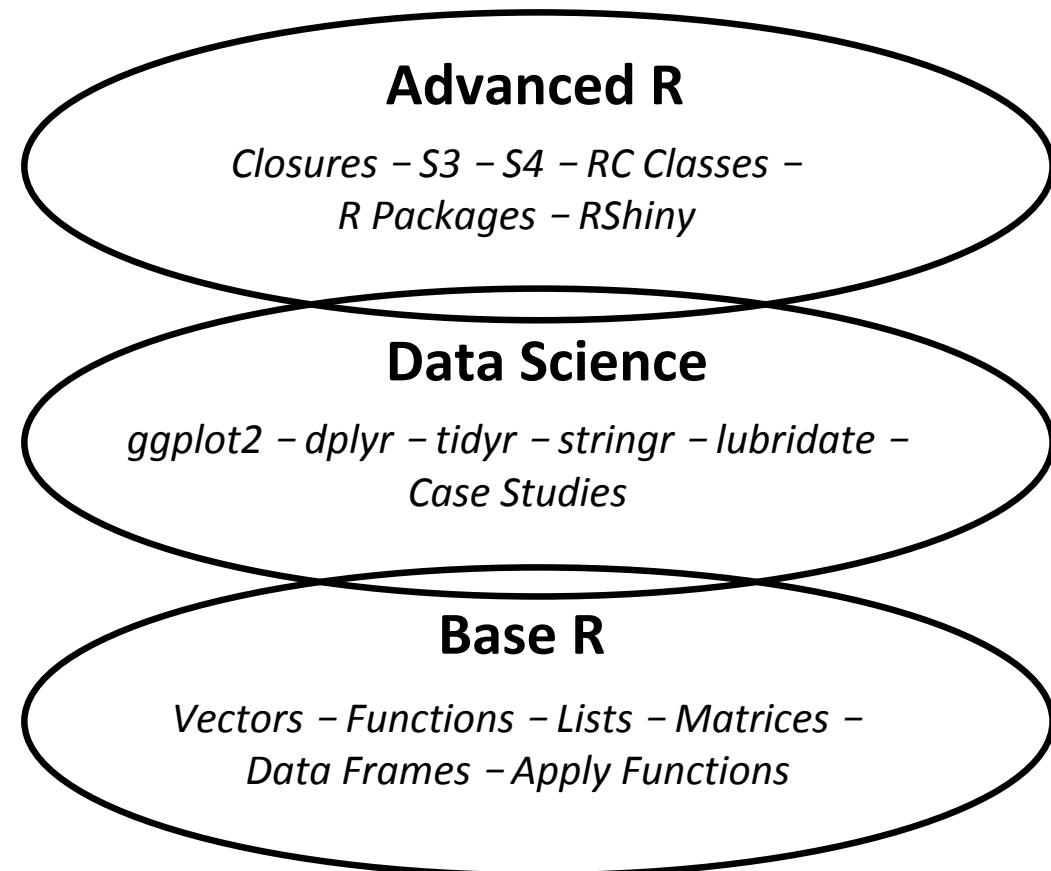

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.

<https://github.com/JimDuggan/CT5102>

# Lecture Overview

- Closures
- RMarkdown
- Rshiny
- Course summary

# (1) Closures

*“An object is data with functions. A closure is a function with data.” John D. Cook.*

- Anonymous functions can be used to create closures, functions written by functions
- Closures get their name because they enclose the environment of the parent function and can then access all its variables
- “Stateful functions (closures) are best used in moderation. As soon as your function starts managing the state of multiple variables, it’s better to switch to R6” (Wickham)

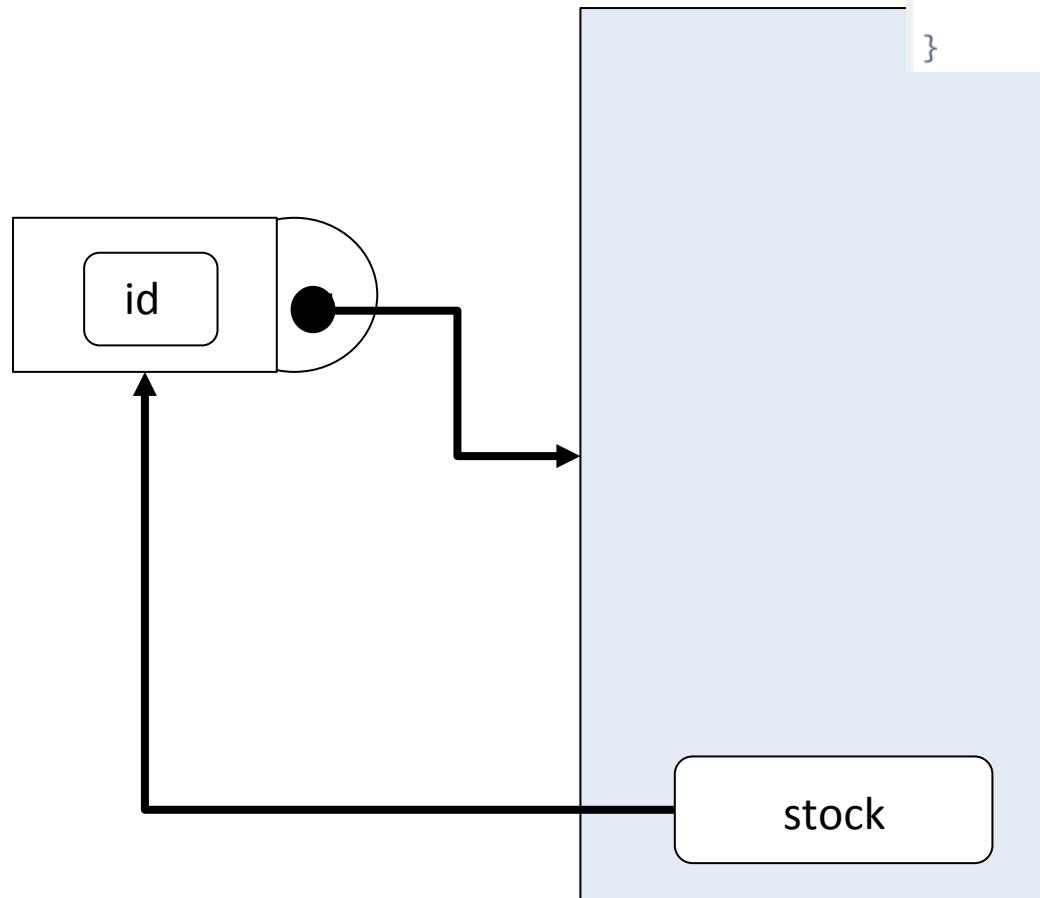

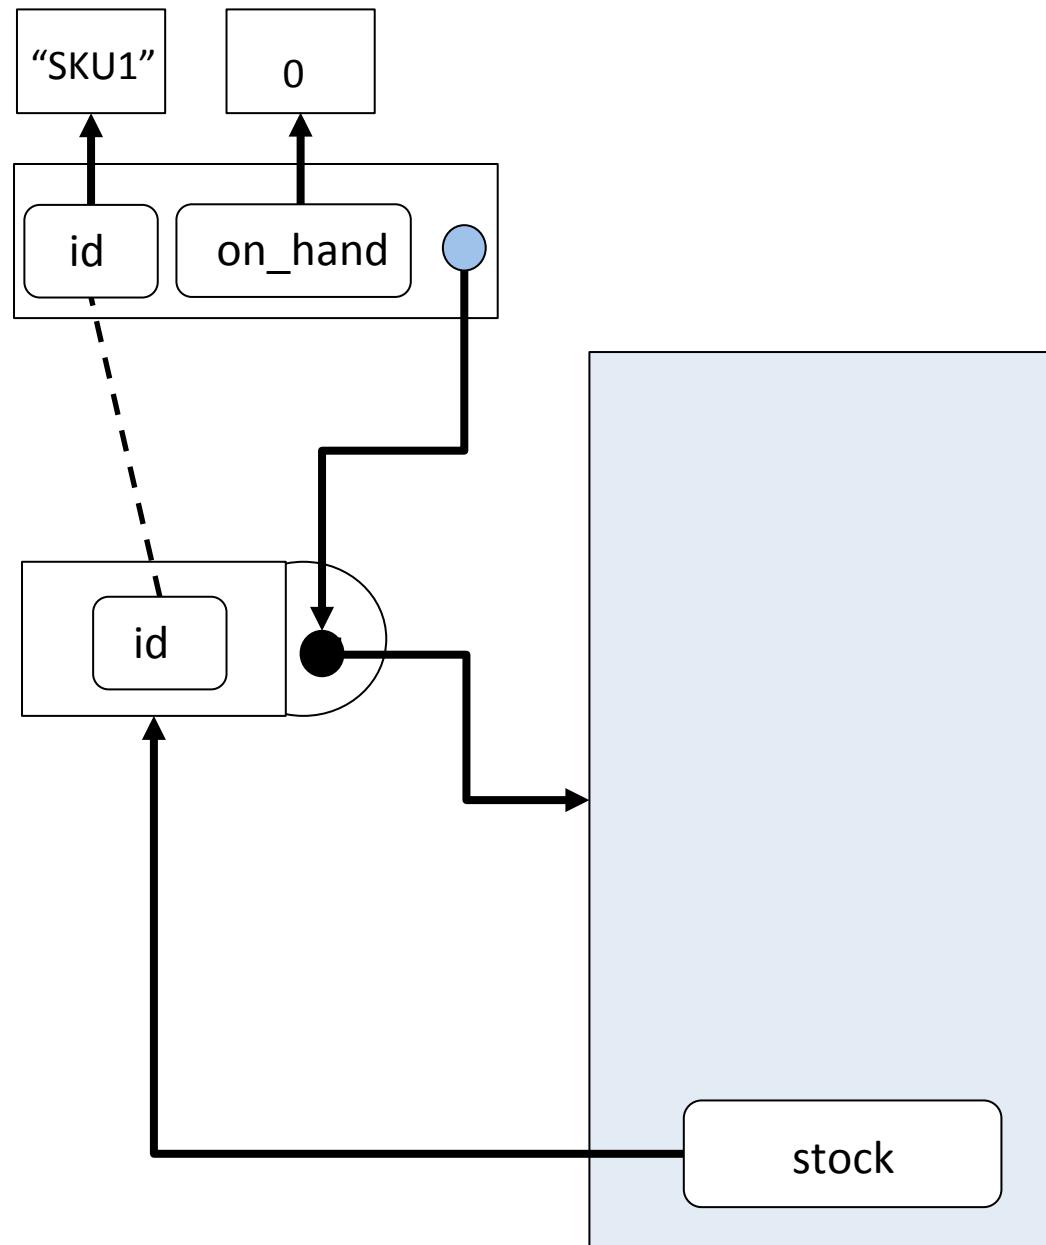

# Closure Example

```
stock <- function(id){  
  id <- id  
  on_hand <- 0  
  list(increment=function(a)on_hand<-on_hand+a,  
       decrement=function(a)on_hand<-on_hand-a,  
       on_hand=function()on_hand,  
       id=function()id,  
       set_id=function(id)id<<-id,  
       get_state=function()list(id=id,  
                                on_hand=on_hand))  
}  
  
s1 <- stock("SKU1")  
  
s1$increment(100)  
s1$on_hand()
```

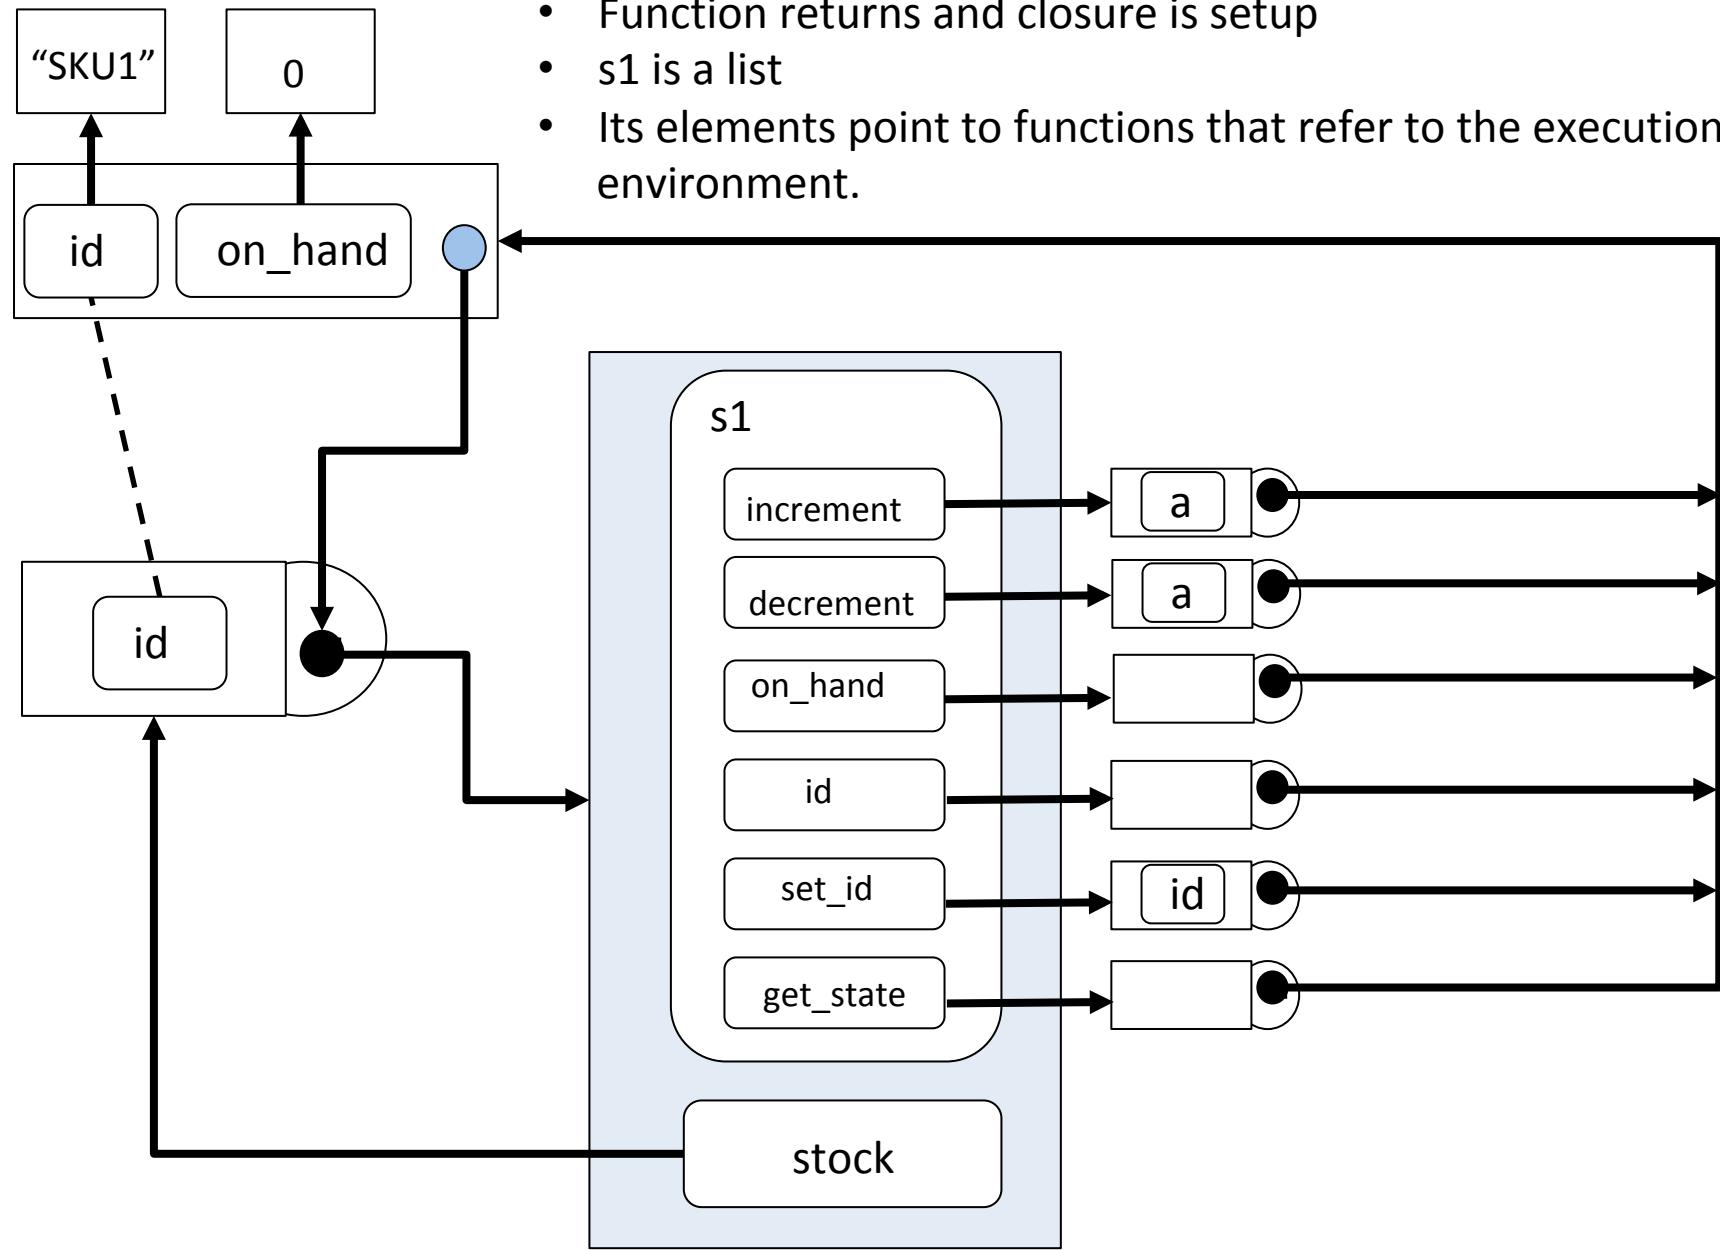

```
stock <- function(id){  
  id <- id  
  on_hand <- 0  
  list(increment=function(a)on_hand<~-on_hand+a,  
       decrement=function(a)on_hand<~-on_hand-a,  
       on_hand=function()on_hand,  
       id=function()id,  
       set_id=function(id)id<~-id,  
       get_state=function()list(id=id,  
                                on_hand=on_hand))  
}
```

Function gets called and execution environment is created (first two lines of code)

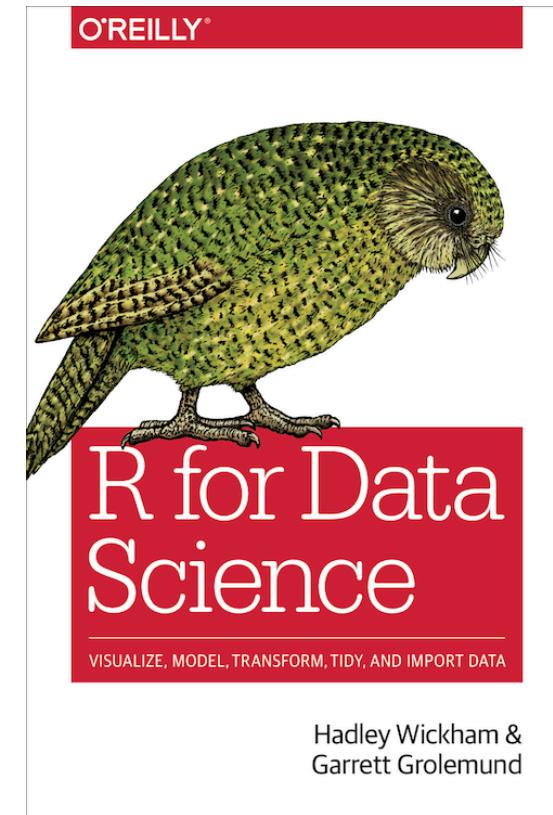

# (2) R Markdown

## (Wickham and Grolemund)

- R Markdown provides a unified authoring framework for data science, combining your code, results and prose commentary
- R Markdown documents are fully reproducible and support many output formats (pdfs, slideshows, and more).

# Why use R Markdown?

- **For communicating to decision makers**, who want to focus on conclusions, not the code behind the analysis.
- **For collaborating with other data scientists**, who are interested in your conclusions, and how you reached them
- As an environment in which to do data science, where you capture not only what you did, but what you were thinking

# R Markdown, loaded by R Studio

- Contains three important types of content:
  - An (optional) YAML header surrounded by `---`
  - Chunks of R Code, surrounded by `````
  - Text mixed with simple text formatting like `# heading` and `_italics_`

# Example

```
---
```

```
title: "Diamond Sizes"
date: 2017-08-25
output:
  html_document: default
---
```

Here is an example of using **R Markdown**.

```
```{r setup, include=FALSE}
library(ggplot2)
library(dplyr)
```

```

```
```{r, echo=FALSE}
smaller <- diamonds %>%
  filter(carat <= 2.5)
```

```

We have data about `r nrow(diamonds)` diamonds in our data set.  
Only **\*\*`r nrow(diamonds) - nrow(smaller)`\*\*** are larger than 2.5 carats.

The distribution of the remainder is show below:

```
```{r, echo=FALSE}
smaller %>%
  ggplot(aes(carat)) +
  geom_freqpoly(binwidth=0.01)

```

```

<https://yihui.name/knitr/options/>

# “knit” to HTML

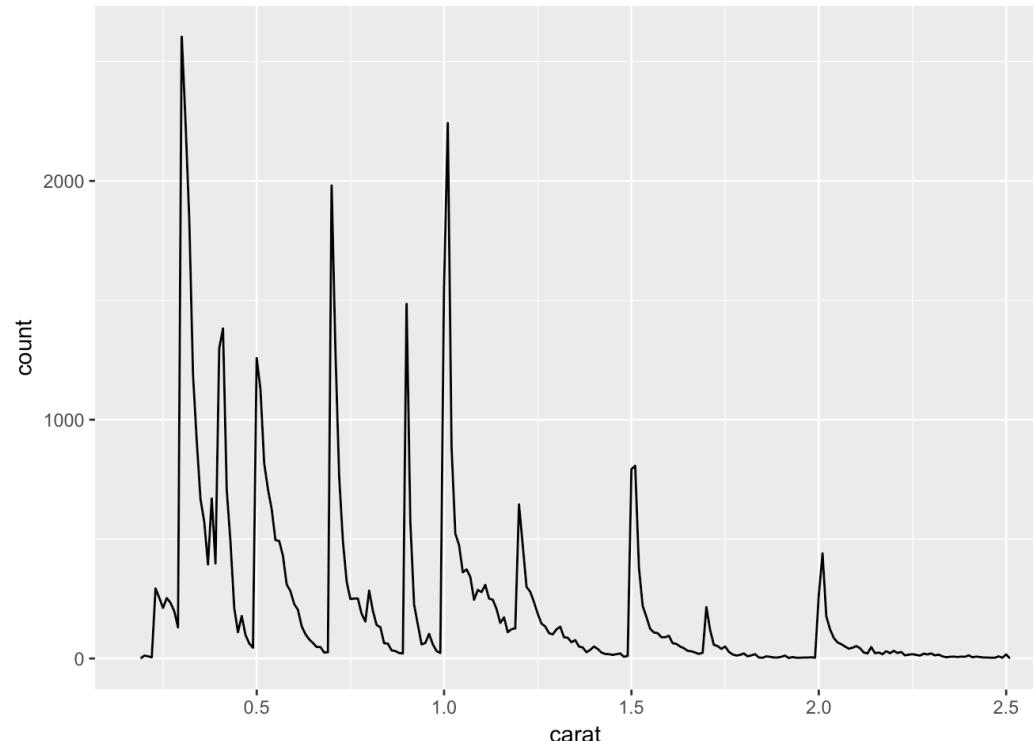

## Diamond Sizes

2017-08-25

Here is an example of using **R Markdown**.

We have data about 53940 diamonds in our data set. Only **126** are larger than 2.5 carats.

The distribution of the remainder is show below:

# “knit” to PDF

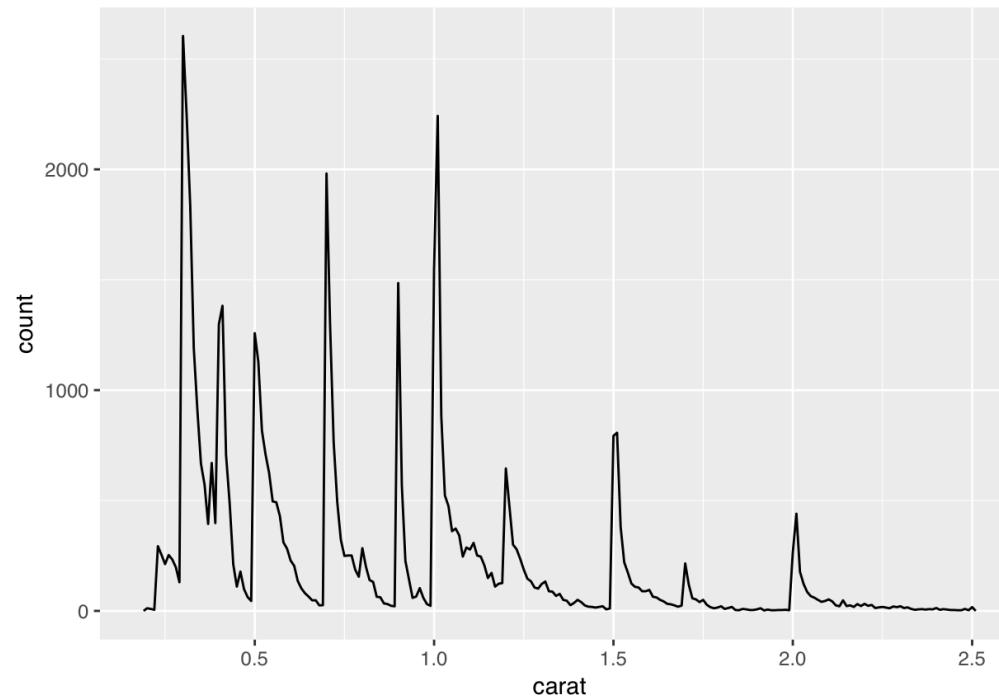

## Diamond Sizes

2017-08-25

Here is an example of using **R Markdown**.

We have data about 53940 diamonds in our data set. Only **126** are larger than 2.5 carats.

The distribution of the remainder is show below:

# Text Formatting with Markdown

- Text Formatting
  - \*italic\* or \_italic\_
  - \*\*bold\*\* or \_bold\_
  - `code`
- Headings
  - # First Level header
  - ## Second Level header
  - ### Third Level header
- Lists
  - \* Bulleted list item 1
  - 1 Numbered list item 1
- Links
  - [linked phrase]<http://example.com>
- Images
  - ![caption text](path/to/imp.png)

# Inserting Chunks (Cmd/Ctrl-Alt-I)

*This table summarizes what types of output each option suppresses...*

| Option          | Run code | Show Code | Output | Plots | Messages | Warnings |
|-----------------|----------|-----------|--------|-------|----------|----------|
| eval = FALSE    | X        |           | X      | X     | X        | X        |
| include = FALSE |          | X         | X      | X     | X        | X        |
| echo = FALSE    |          | X         |        |       |          |          |
| results= "hide" |          |           | X      |       |          |          |
| fig.show="hide" |          |           |        | X     |          |          |
| message=FALSE   |          |           |        |       | X        |          |
| Warning=FALSE   |          |           |        |       |          | X        |

# Table

```
---
```

```
title: "Table Test"
output: html_document
```

```
--
```

```
```{r}

# YAML Header

- “Yet Another Markup Language”
- Useful features
  - Parameters
  - Bibliographies

# Example

```
---
```

```
title: "Parameter Test"
bibliography: ref.bib
params:
  my_class: suv
  my_time: !r lubridate::now()
```

```
output:
  html_document: default
  pdf_document: default
---
```

```
|
```

```
The time is now `r params$my_time`
```

```
The reference is [@paper1]
```

```
```{r setup, include=FALSE}
library(ggplot2)
library(dplyr)

class <- mpg %>% filter(class == params$my_class)

```

```

```
```{r, message=FALSE}
ggplot(class,aes(x=displ,y=hwy))+
  geom_point()+
  geom_smooth(se=F)
```

```
```

```

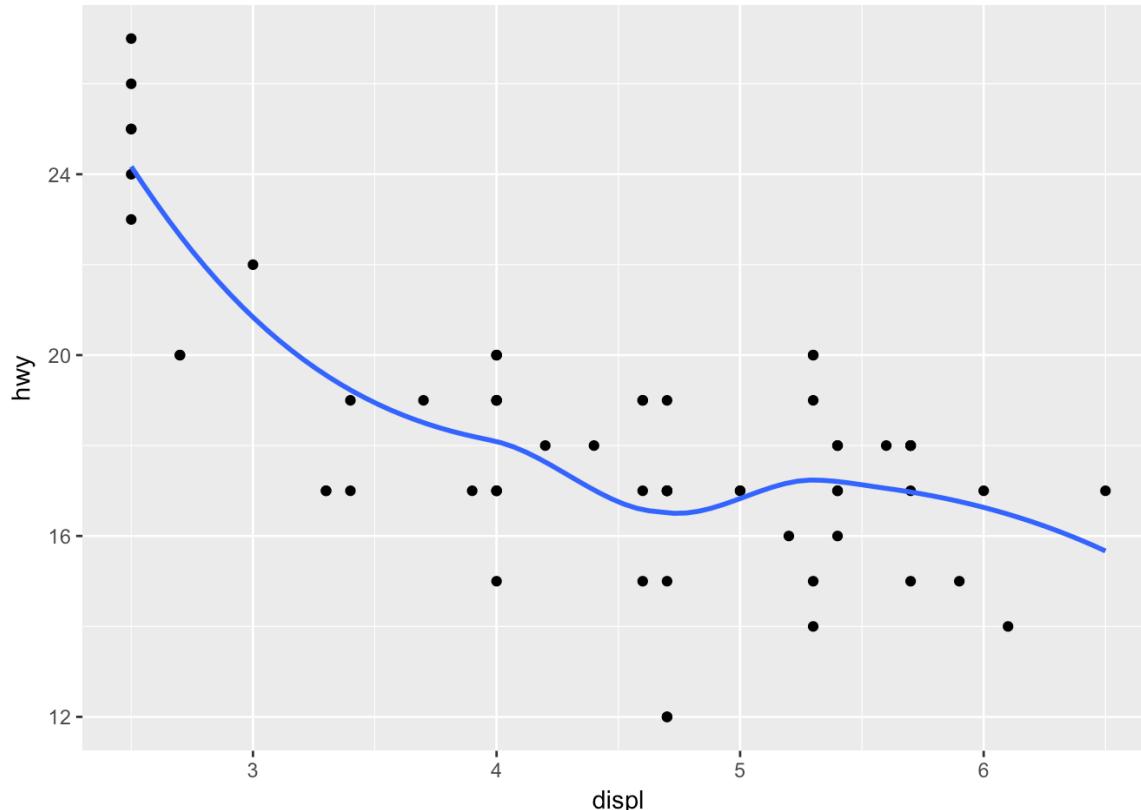

# Parameter Test

The time is now 2017-11-15 19:41:58

The reference is (Koppeschaar et al. 2017)

```
ggplot(class,aes(x=displ,y=hwy))+
  geom_point()+
  geom_smooth(se=F)
```

Koppeschaar, E. Carl, Vittoria Colizza, Caroline Guerrisi, Clément Turbelin, Jim Duggan, John W. Edmunds, Charlotte Kjelsø, et al. 2017.

# (3) RShiny

The screenshot shows the Shiny Studio interface. At the top, it says "Interactive Web Apps with shiny: Cheat Sheet" and "Learn more at shinyapps.org". Below this is a "Studio" section with tabs for "Basics", "App Examples", and "Building an App". The "Building an App" tab is active, displaying a complex R script with various UI components like inputs, outputs, and server logic. To the right of the code, there's a "UI" pane showing the corresponding HTML and CSS for the app's user interface.

- A Shiny app is a web page (UI) connected to a computer running a live R session (Server)

- Users can manipulate the UI which will cause the server to update the UI's displays (by running code)

# App template

- **ui** – nested R functions that represent an HTML user interface for your app
- **server** – a function with instructions on how to build and rebuild the R objects displayed in the UI
- **shinyApp** – combines the **ui** and **server** into a functioning app.

```
library(shiny)
ui <- fluidPage()
server <- function(input, output){}
shinyApp(ui = ui, server = server)
```

# Building an App

Add inputs to the UI with **\*Input()** functions

Add outputs with **\*Output()** functions

Tell server how to render outputs with R in the server function. To do this:

1. Refer to outputs with **output\$<id>**

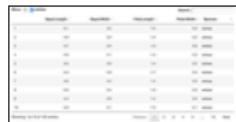

2. Refer to inputs with **input\$<id>**

3. Wrap code in a **render\*()** function before saving to output

```
library(shiny)  
ui <- fluidPage(  
  numericInput(inputId = "n",  
               "Sample size", value = 25),  
  plotOutput(outputId = "hist")  
)  
  
server <- function(input, output) {  
  output$hist <- renderPlot({  
    hist(rnorm(input$n))  
  })  
}  
  
shinyApp(ui = ui, server = server)
```

## Outputs - render\*() and \*Output() functions work together to add R output to the UI

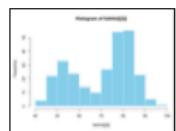

`DT::renderDataTable(expr, options, callback, escape, env, quoted)`

`dataTableOutput(outputId, icon, ...)`

`renderImage(expr, env, quoted, deleteFile)`

`renderPlot(expr, width, height, res, ..., env, quoted, func)`

'data.frame': 3 obs. of 2 variables:

\$ Sepal.Length: num 5.1 4.9 4.7

\$ Sepal.Width : num 3.5 3 3.2'

`renderPrint(expr, env, quoted, func, width)`

|   | Sepal.Length | Sepal.Width | Petal.Length | Petal.Width | Species     |
|---|--------------|-------------|--------------|-------------|-------------|
| 1 | 5.1          | 3.5         | 1.4          | 0.2         | Iris-setosa |
| 2 | 4.9          | 3.0         | 1.4          | 0.2         | Iris-setosa |
| 3 | 4.7          | 3.2         | 1.3          | 0.2         | Iris-setosa |

foo

`renderTable(expr, ..., env, quoted, func)`

`tableOutput(outputId)`

`renderText(expr, env, quoted, func)`

`textOutput(outputId, container, inline)`

`renderUI(expr, env, quoted, func)`

`uiOutput(outputId, inline, container, ...)`  
& `htmlOutput(outputId, inline, container, ...)`

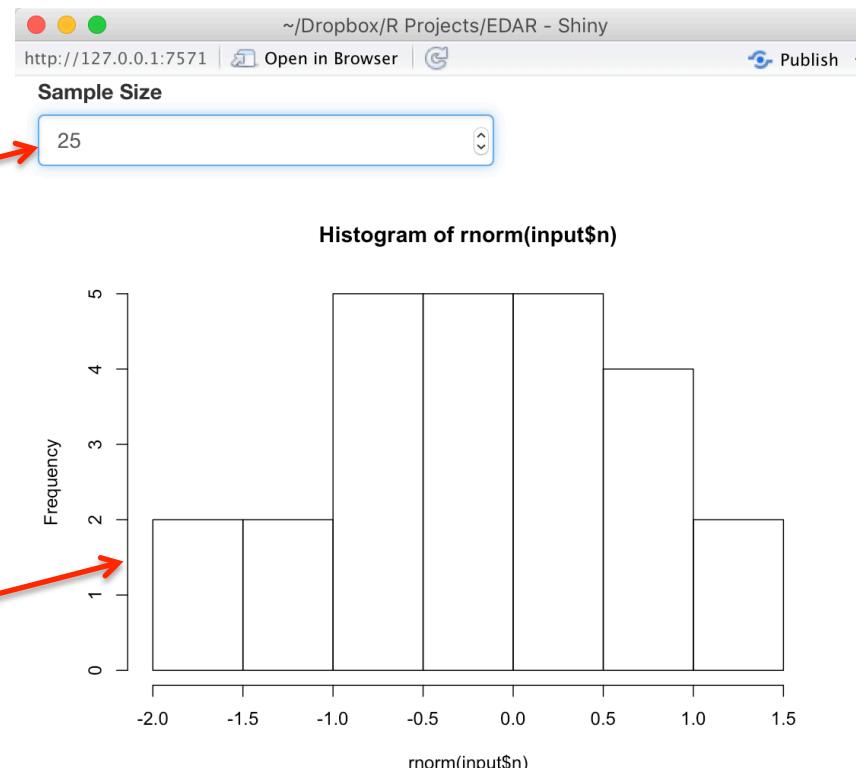

# Example

```
library(shiny)

ui <- fluidPage(
  numericInput(inputId = "n",
               "Sample Size",
               value=25),
  plotOutput(outputId = "hist")
)

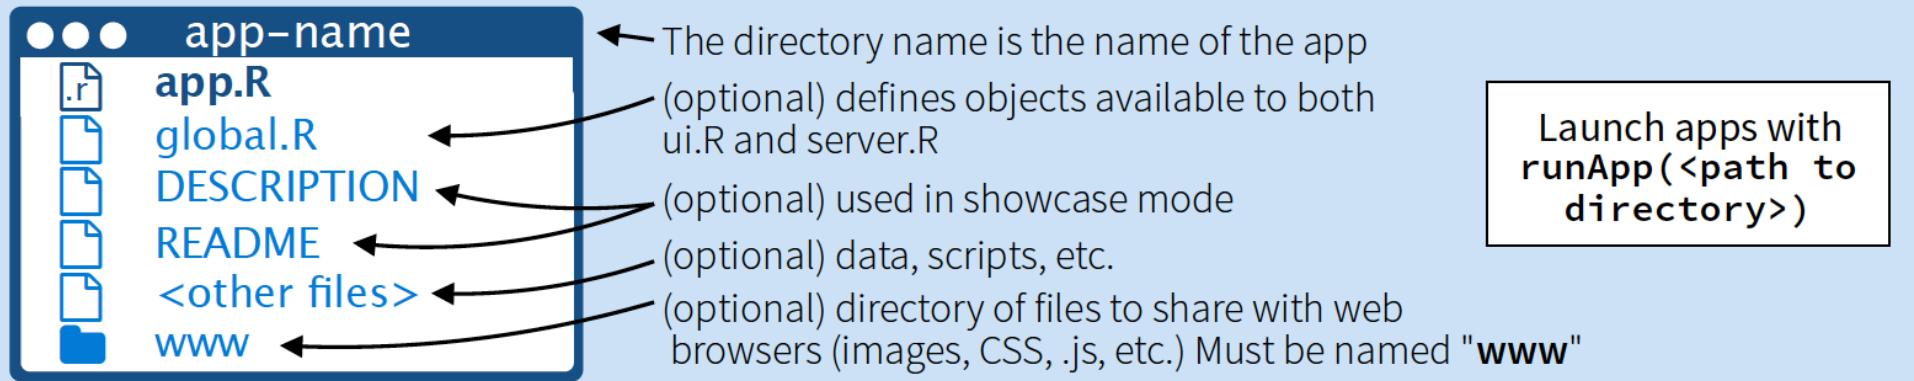

server <- function(input, output){
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}

shinyApp(ui = ui, server = server)
```

# File Organisation

Save each app as a directory that contains an **app.R** file (or a **server.R** file and a **ui.R** file) plus optional extra files.

## Inputs - collect values from the user

Access the current value of an input object with **input \$<inputId>**. Input values are **reactive**.

Action

**actionButton(inputId, label, icon, ...)**

Link

**actionLink(inputId, label, icon, ...)**

- Choice 1
- Choice 2
- Choice 3
- Check me

Choose File

**checkboxGroupInput(inputId, label, choices, selected, inline)**

**checkboxInput(inputId, label, value)**

**dateInput(inputId, label, value, min, max, format, startview, weekstart, language)**

**dateRangeInput(inputId, label, start, end, min, max, format, startview, weekstart, language, separator)**

**fileInput(inputId, label, multiple, accept)**

.....

- Choice A
- Choice B
- Choice C

Choice 1 ▾  
Choice 1  
Choice 2

Apply Changes

Enter text

**numericInput(inputId, label, value, min, max, step)**

**passwordInput(inputId, label, value)**

**radioButtons(inputId, label, choices, selected, inline)**

**selectInput(inputId, label, choices, selected, multiple, selectize, width, size) (also selectizeInput())**

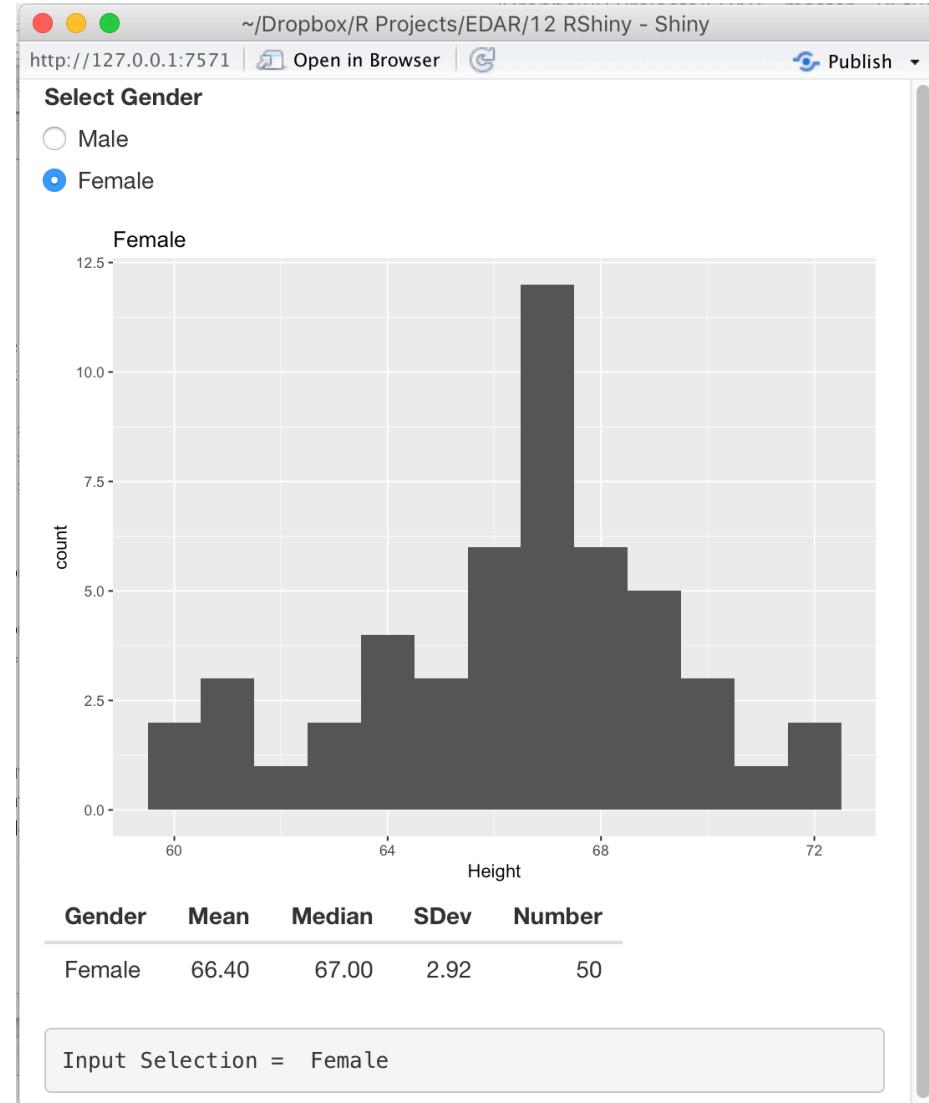

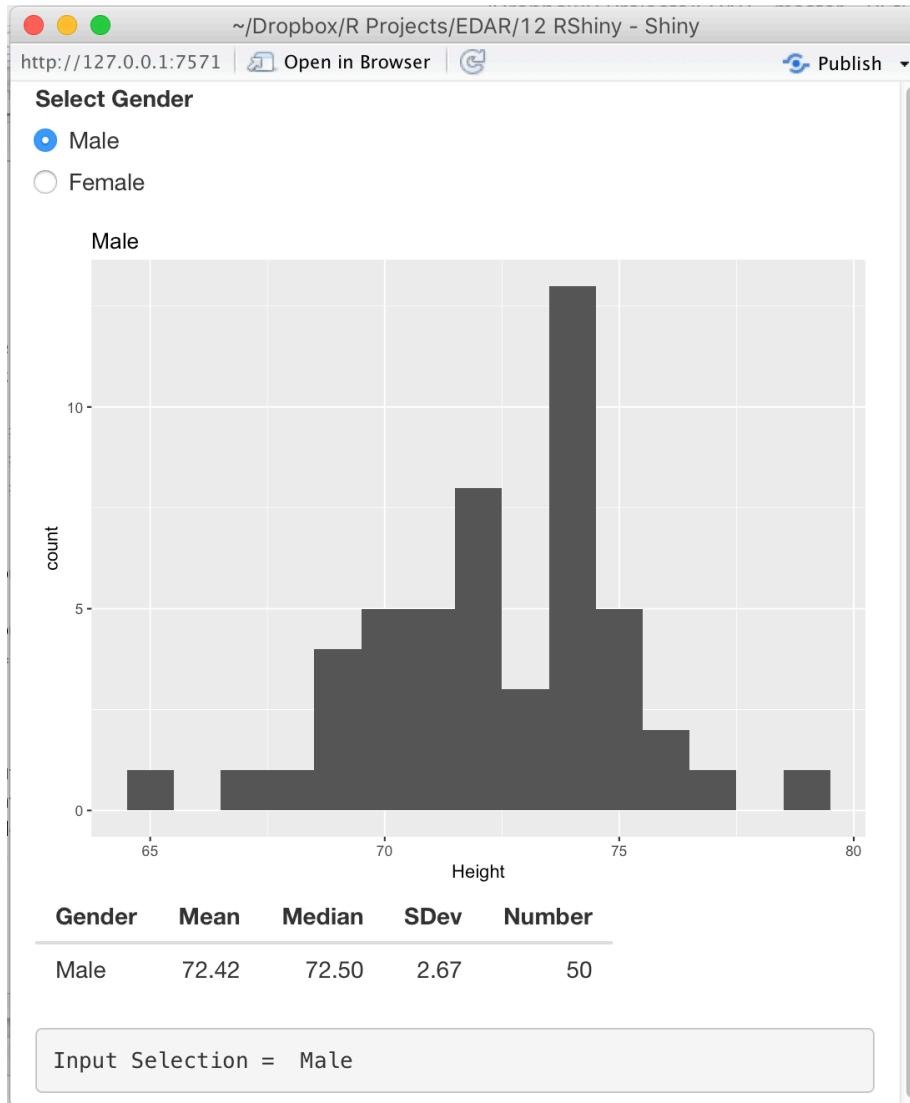

**sliderInput(inputId, label, min, max, value, step, round, format, locale, ticks, animate, width, sep, pre, post)**

**submitButton(text, icon)**  
(Prevents reactions across entire app)

**textInput(inputId, label, value)**

# Additional Example...

```

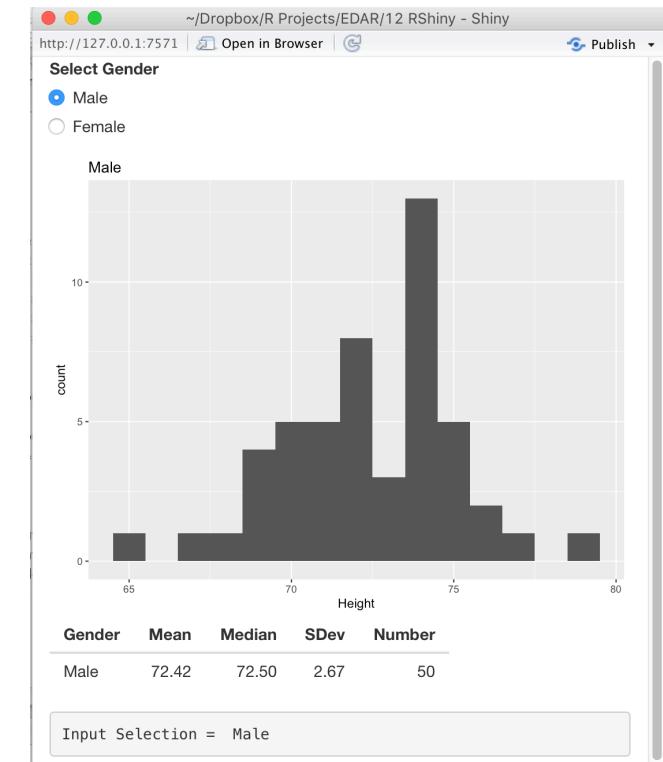

ui <- fluidPage(
  radioButtons(inputId = "gender",
              label    = "Select Gender",
              c("Male", "Female")),
  plotOutput("hist"),           # to plot a chart
  tableOutput("tab"),          # to generate a table
  verbatimTextOutput("text")
)

server <- function (input, output){
  output$hist <- renderPlot({
    ggplot(filter(d, Gender==input$gender), aes(Height)) +
      geom_histogram(binwidth = 1) + ggtitle(input$gender)
  })

  output$tab <- renderTable({
    sd <- filter(d, Gender==input$gender) %>% group_by(Gender) %>%
      summarise(Mean=mean(Height),
                Median=median(Height),
                SDev=sd(Height),
                Number=n())
  })

  output$text <- renderPrint({
    cat("Input Selection = ", input$gender, "\n")
  })
}

```

# Setup code

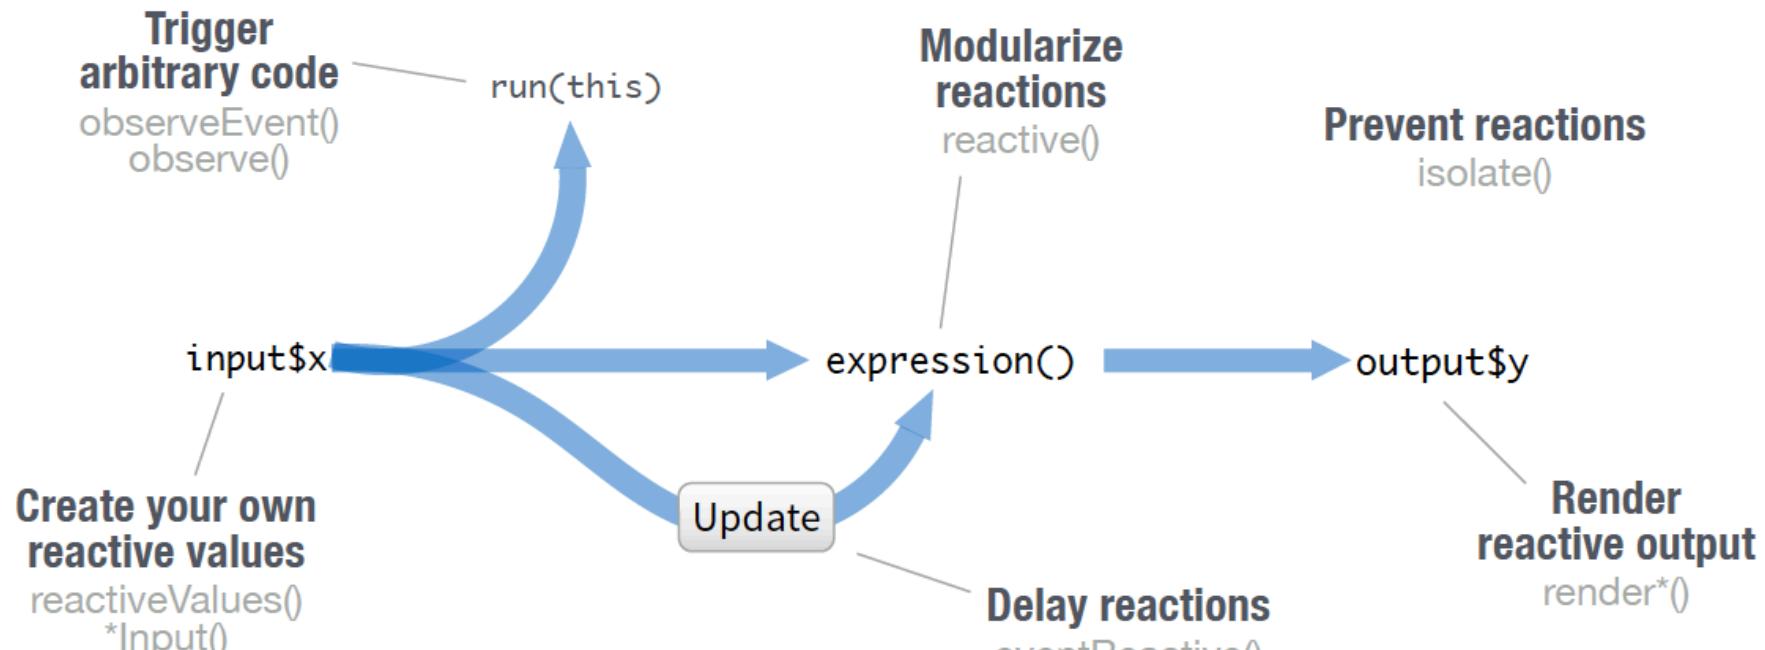

```
d <- read_csv("HopeCollegeHeights.csv")  
  
d <- d %>% mutate(Gender=as.factor(ifelse(Gender==1,"Female","Male")))  
  
shinyApp(ui = ui, server = server)
```

# More complex structures... supports Action Buttons and Shared State

## Reactivity

Reactive values work together with reactive functions. Call a reactive value from within the arguments of one of these functions to avoid the error `Operation not allowed without an active reactive context.`

## Create your own reactive values

```
# example snippets

ui <- fluidPage(
 textInput("a","","A")
)

server <-
function(input,output){
  rv <- reactiveValues()
  rv$number <- 5
}
```

### \*Input() functions

(see front page)

### reactiveValues(...)

Each input function creates a reactive value stored as `input$<inputId>`

`reactiveValues()` creates a list of reactive values whose values you can set.

## Render reactive output

### render\*() functions

(see front page)

Builds an object to display. Will rerun code in body to rebuild the object whenever a reactive value in the code changes.

Save the results to `output$<outputId>`

## Prevent reactions

```
library(shiny)
ui <- fluidPage(
 textInput("a","","A"),
  textOutput("b")
)

server <-
function(input,output){
  output$b <-
    renderText({
      isolate({input$a})
    })
}

shinyApp(ui, server)
```

### isolate(expr)

Runs a code block. Returns a non-reactive copy of the results.

## Trigger arbitrary code

```
library(shiny)
ui <- fluidPage(
 textInput("a","","A"),
  actionButton("go","Go")
)

server <-
function(input,output){
  observeEvent(input$go,{
    print(input$a)
  })
}

shinyApp(ui, server)
```

`observeEvent(eventExpr, handlerExpr, event.env, event.quoted, handler.env, handler.quoted, label, suspended, priority, domain, autoDestroy, ignoreNULL)`

Runs code in 2nd argument when reactive values in 1st argument change. See `observe()` for alternative.

## Modularize reactions

```
library(shiny)
ui <- fluidPage(
 textInput("a","","A"),
  textInput("z","","Z"),
  textOutput("b")
)

server <-
function(input,output){
  re <- reactive({
    paste(inputs$a,input$z)
  })
  output$b <- renderText({
    re()
  })
}

shinyApp(ui, server)
```

`reactive(x, env, quoted, label, domain)`  
Creates a reactive expression that

- caches its value to reduce computation
  - can be called by other code
  - notifies its dependencies when it has been invalidated
- Call the expression with function syntax, e.g. `re()`

## Delay reactions

```
library(shiny)
ui <- fluidPage(
 textInput("a","","A"),
  actionButton("go","Go"),
  textOutput("b")
)

server <-
function(input,output){
  re <- eventReactive(
    input$go,{input$a})
  output$b <- renderText({
    re()
  })
}

shinyApp(ui, server)
```

`eventReactive(eventExpr, valueExpr, event.env, event.quoted, value.env, value.quoted, label, domain, ignoreNULL)`

Creates reactive expression with code in 2nd argument that only invalidates when reactive values in 1st argument change.

## UI

An app's UI is an HTML document. Use Shiny's functions to assemble this HTML with R.

```
fluidPage(
  textInput("a", ""))
) Returns HTML
```

**HTML** Add static HTML elements with `tags`, a list of functions that parallel common HTML tags, e.g. `tags$a()`. Unnamed arguments will be passed into the tag; named arguments will become tag attributes.

|                  |                   |              |                |                |

| tags\$canvas     | tags\$footer      | tags\$li     | tags\$sr       | tags\$tr       |
| tags\$caption    | tags\$form        | tags\$link   | tags\$samp     | tags\$track    |
| tags\$cite       | tags\$h1          | tags\$mark   | tags\$script   | tags\$u        |
| tags\$code       | tags\$h2          | tags\$map    | tags\$section  | tags\$ul       |
| tags\$col        | tags\$h3          | tags\$menu   | tags\$select   | tags\$var      |
| tags\$colgroup   | tags\$h4          | tags\$meta   | tags\$small    | tags\$video    |
| tags\$command    | tags\$h5          | tags\$meter  | tags\$source   | tags\$wbr      |

The most common tags have wrapper functions. You do not need to prefix their names with `tags$`

```
ui <- fluidPage(
  h1("Header 1"),
  hr(),
  br(),
  p(strong("bold")),
  p(em("italic")),
  p(code("code")),
  a(href="", "link"),
  HTML("<p>Raw html</p>"))
```

**CSS** To include a CSS file, use `includeCSS()`, or  
1. Place the file in the `www` subdirectory  
2. Link to it with

```
tags$head(tags$link(rel = "stylesheet",
  type = "text/css", href = "<file name>"))
```

**JS** To include JavaScript, use `includeScript()`  
1. Place the file in the `www` subdirectory  
2. Link to it with

```
tags$head(tags$script(src = "<file name>"))
```

**IMAGES** To include an image  
1. Place the file in the `www` subdirectory  
2. Link to it with `img(src = "<file name>")`

## Layouts

Combine multiple elements into a "single element" that has its own properties with a panel function, e.g.

```
weUIPanel(
  dateInput("a", ""),
  submitButton()
)
```

**absolutePanel()** **InputPanel()** **tabPanel()**  
**conditionalPanel()** **mainPanel()** **tabsetPanel()**  
**fixedPanel()** **navlistPanel()** **titlePanel()**  
**headerPanel()** **sidebarPanel()** **wellPanel()**

Organize panels and elements into a layout with a layout function. Add elements as arguments of the layout functions.

**fluidRow()**

```
ui <- fluidPage(
  fluidRow(column(width = 4),
    column(width = 2, offset = 3)),
  fluidRow(column(width = 12)))
)
```

**flowLayout()**

```
ui <- fluidPage(
  flowLayout(# object 1,
            # object 2,
            # object 3)
)
```

**sidebarLayout()**

```
ui <- fluidPage(
  sidebarLayout(
    sidebarPanel(),
    mainPanel()
)
)
```

**splitLayout()**

```
ui <- fluidPage(
  splitLayout(# object 1,
             # object 2)
)
```

**verticalLayout()**

```
ui <- fluidPage(
  verticalLayout(# object 1,
                # object 2,
                # object 3)
)
```

Layer tabPanels on top of each other, and navigate between them, with:

```
ui <- fluidPage(tabsetPanel(
  tabPanel("tab 1", "contents"),
  tabPanel("tab 2", "contents"),
  tabPanel("tab 3", "contents")))
ui <- fluidPage(navlistPanel(
  tabPanel("tab 1", "contents"),
  tabPanel("tab 2", "contents"),
  tabPanel("tab 3", "contents")))
ui <- navbarPage(title = "Page",
  tabPanel("tab 1", "contents"),
  tabPanel("tab 2", "contents"),
  tabPanel("tab 3", "contents"))
```

# Course Summary

## Programming for Data Analytics

### 1. Introduction to R and Atomic Vectors

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## Programming for Data Analytics

### 2. Lists and Functions

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
[https://twitter.com/\\_jimduggan](https://twitter.com/_jimduggan)

## Programming for Data Analytics

### 3. Matrices and Functionals

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
[https://twitter.com/\\_jimduggan](https://twitter.com/_jimduggan)

## Programming for Data Analytics

### 4. Data Frames

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## Programming for Data Analytics

### 5. ggplot2

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## Programming for Data Analytics

### Lecture 6: Introduction to dplyr

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
[https://twitter.com/\\_jimduggan](https://twitter.com/_jimduggan)

## Programming for Data Analytics

### Lecture 7: Relational Data and tidy

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## Programming for Data Analytics

### Lecture 8: stringr

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
[https://twitter.com/\\_jimduggan](https://twitter.com/_jimduggan)

## CT5102: Programming for Data Analytics

### Lecture 9: The S3 Object System

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## CT5102: Programming for Data Analytics

### Lecture 10: Packages

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## CT5102: Programming for Data Analytics

### Lecture 11: Environments & Functions

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>

## CT5102: Programming for Data Analytics

### Lecture 12: Course Summary

Dr. Jim Duggan,  
School of Engineering & Informatics  
National University of Ireland Galway.  
<https://github.com/jimDuggan/CT5102>
